Accurate risk assessment by general practitioners (GPs) of breast cancer for unaffected women with a family history is important to ensure appropriate referral. Family cancer clinics can provide significant benefits for those at high risk, but genetic testing is unlikely to benefit those who are unaffected, or have little or no family history.

This free seminar will provide an update for general practice on the management of patients with an increased risk of breast cancer and the pros and cons of diagnostic breast imaging.

Learning outcomes*

- Assess and investigate a patient who presents with a new breast symptom
- Undertake a family history relevant to familial cancer
- Identify the most appropriate breast imaging modalities for women with symptoms
- Explain the potential medical prevention options to high risk breast cancer patients
- Summarise psychosocial implications of genetic testing and genetic mutation carriage

**Please note these learning outcomes are subject to change*

Presenters

Professor Christobel Saunders, Head, Division of Surgery, UWA
Medical School

Dr Joanne Lazberger, Consultant Radiologist, Perth Radiology Clinic

Dr Jacqui Thomson, Consultant Radiologist, Perth Radiology Clinic

This education is a CPD Activity under the RACGP CPD Program
